

HYDRAULIC FILTERS

FOR USE WITH PETROLEUM BASE FLUIDS

IN-LINE TYPE
SERIES F1/F2
Specification Sheet

The CROSS series F1 and F2 in-line type hydraulic oil filters are high quality low cost units featuring spin-on, throw-away elements. The thru-type by-pass valve is available in 15 or 25 psi for return line installations and 5 psi for suction line applications. A specially engineered seal permits usage up to 200 psi.

APPLICATIONS (TYPICAL)

Hydraulic system preventive maintenance, with regular filter element changes, is essential to assure long life of components and to prevent personal injury resulting from equipment malfunction. Spin-on filters should be changed after 50 hours of initial use and then after every one hundred hours of use.

If the CROSS filter becomes clogged with contamination before changing, the internal by-pass valve opens at the pre-set pressure to prevent collapse of the element (return line). A filter must be sized to handle the maximum flow at its position in the system; i.e., a return line filter in a regenerative or accumulator system must be capable of handling the full flow being returned to the reservoir which is frequently in excess of the pump output capacity.
